

API CONNECTIONS

Setup & fix guide

Fixing the Resend red light, and connecting every other API — from one new control page in your admin.

For	Platform	Date
The owner	kclinics.co.uk	14 June 2026

Connection Centre

Every external service in one place — its live status, the keys it needs, the Connect step for accounts like Xero or Google, and the exact webhook and redirect URLs to paste into each provider.

01 Start here — the urgent one: Resend is red

Short version: **your Resend DNS is correct. The red light is a key problem, not a DNS problem.** I checked every record live.

WHAT I CHECKED, AND WHAT I FOUND

The platform sends from `mail.kclinics.co.uk`. Resend needs three DNS records on that subdomain. All three are present and correct:

Record	Where	Found live	OK?
SPF (TXT)	<code>send.mail.kclinics.co.uk</code>	<code>v=spf1 include:amazonses.com ~all</code>	•
Return-path (MX)	<code>send.mail.kclinics.co.uk</code>	<code>feedback-smtp.eu-west-1.amazonses.com</code>	•
DKIM (TXT)	<code>resend._domainkey.mail.kclinics.co.uk</code>	<code>p=MIGfMA0...</code> (present)	•
DMARC (TXT)	<code>_dmarc.kclinics.co.uk</code>	<code>v=DMARC1; p=none</code>	•

So sending is fully set up in DNS. (You also have the apex domain `kclinics.co.uk` set up in Resend — its records are correct too.)

WHY IT'S RED, THEN

The health check only shows **red** in two cases: the API key is **missing**, or the key is **rejected (401)**. A missing or unverified domain would show **amber**, not red. So the cause is the key itself.

FIX IT — FIVE STEPS

Fix the Resend key

1. Open the admin → **Connection Centre** → the **Email — Resend** card.
2. In a new tab go to `resend.com/api-keys`. Check a key exists and that it's in the **same account** where `mail.kclinics.co.uk` is verified. If unsure, click **Create API Key**, name it `kclinics-prod`, permission **Full access**, and **Copy** it (starts `re_`; shown once).
3. Back in the Connection Centre, paste it into **Resend API key** and press **Save**. No spaces before or after.
4. Set **From address** to `KClinics <hello@mail.kclinics.co.uk>` (or your verified sender).
5. Press **Re-check now**. Green means fixed.

IF IT'S STILL RED WITH A FRESH KEY

The key is being rejected — it's from a different Resend account/team than the one holding the domain, or it was revoked. Create the key in the account that owns `mail.kclinics.co.uk`. If the check turns **amber** instead ("no verified domain"), open Resend → Domains → `mail.kclinics.co.uk` → **Verify** (the DNS is already there, so it passes immediately).

K's tip
Red almost always means "bad key", amber means "key fine, domain/step missing", green means "go". Read the colour first — it tells you which half of the problem you have.

ONE SMALLER THING I SPOTTED (NOT THE RED)

Replies are meant to land on `reply.mail.kclinics.co.uk`, but that subdomain has no MX record (your inbound mail is set on `mail.kclinics.co.uk` instead). Sending isn't affected, but client replies to automated emails may not thread back in. Optional fix: set **Reply-to address** in the Resend card to a real monitored mailbox (e.g. `hello@kclinics.co.uk`), or add Resend Inbound's MX record for `reply.mail`.

02 Your new control centre — one page for everything

API keys and connections used to be spread across four pages (Integrations, Credentials, API health, Marketing connections), and some providers — Google especially — were managed in several places at once. I've centralised it all into one screen: **Admin** → **Administration** → **Connection Centre** (`/admin/connections`).

kclinics.co.uk/admin/connections

Connection Centre

Every external service in one place — its live status, the keys it needs, the Connect step for accounts like Xero or Google, and the exact webhook and redirect URLs to paste into each provider.

The Connection Centre. One card per service: live status, the keys it needs, the Connect button, and the URLs to copy.

WHAT EACH CARD GIVES YOU

On the card	What it does
Status light + line	Live result from a real test call. Green = working, amber = one step left, red = broken, grey = not tested yet.
Key boxes	Paste a key and press Save — it's encrypted and live immediately, no developer or redeploy. "Set in app" means it's saved here; "From hosting" means it's in Vercel.
Connect button	For accounts like Xero, TrueLayer and Google — does the one-time sign-in after the keys are saved.
Copy buttons	The exact webhook / redirect URL to paste into that provider's dashboard.
Re-check now (top)	Re-runs every live test and refreshes all the lights. Takes a few seconds.

K's tip

Work top to bottom and fix red first, then amber. After each change press Re-check now and watch the light. You never need to leave this page except to paste a URL into a provider.

03 Close each gap — provider by provider

Do these in any order from the Connection Centre. Each is: paste the key(s), then the one extra step if it has one.

KCLINICS

API Connections — Setup & Fix Guide · confidential

14 June 2026

Stripe (payments) — hosting + webhook

Stripe keys are build-time, so they live in hosting, not the in-app box.

- 1. In Vercel → k-clinics → Settings → Environment Variables, set `STRIPE_SECRET_KEY` and `NEXT_PUBLIC_STRIPE_PUBLISHABLE_KEY` (from dashboard.stripe.com/apikeys), then Redeploy.
- 2. In Stripe → Developers → Webhooks → Add endpoint, paste the **Payment webhook** URL from the Stripe card (Copy button).
- 3. Copy the signing secret Stripe shows and set it in Vercel as `STRIPE_WEBHOOK_SECRET` ; redeploy.

Anthropic (all AI) — one key

- 1. Open console.anthropic.com → Billing, add a small credit.
- 2. Settings → API Keys → Create Key, copy it (starts `sk-ant-`).
- 3. Paste into the **AI — Anthropic** card → Save → Re-check. This one key powers the kiosk, live chat, Get-My-Plan, marketing copy and SEO help.

Twilio (SMS) — three values

- 1. From console.twilio.com copy the Account SID and Auth Token.
- 2. Buy a phone number in Twilio for the “from” number.
- 3. Paste all three into the **SMS — Twilio** card → Save → Re-check.

Xero (accounting) — keys, redirect, Connect

- 1. At developer.xero.com open your app (or create a Web app).
- 2. Copy the **OAuth redirect URI** from the Xero card and paste it into Xero → Redirect URIs.
- 3. Copy the Client id and a new Client secret from Xero into the card → Save.
- 4. Press **Connect Xero** and authorise. The light goes green when the cash position is live.

TrueLayer (live bank balance) — keys, redirect, Connect

- 1. At console.truelayer.com copy the Client id and secret into the **Bank feed** card.
- 2. Copy the redirect URI from the card into TrueLayer → Redirect URIs.
- 3. Press **Connect bank** and choose your bank.

Google — one client powers reviews, Ads, Analytics & Search

The same Google client ID/secret is used by several features. Set it once in the Connection Centre and it flows to all of them.

- 1. At console.cloud.google.com → Credentials, create (or open) an OAuth client.
- 2. Copy the **redirect URI** from the **Google reviews** card into Google → Authorised redirect URIs. (Also add the marketing redirect if you use Ads — shown on Marketing → Connections.)
- 3. Paste the Client ID + secret into the card → Save.
- 4. Press **Connect Google** for reviews. For Ads/Analytics, add the IDs on the Google Ads / GA4 cards and connect the account on Marketing → Connections.

Deepgram (voice notes) & Translation — optional

- 1. Deepgram: key from console.deepgram.com into the Voice notes card (needs the Anthropic key too).
- 2. Translation: a DeepL or Google Translate key into the Translation card — either is enough.

04 Reference — every URL to register

These live URLs go into each provider's dashboard. The Connection Centre has a Copy button for each, but here they are in one place.

Provider · purpose	URL to paste	Where in the provider
Stripe · payment webhook	<code>https://kclinics.co.uk/api/stripe/webhook</code>	Developers → Webhooks
Resend · delivery events	<code>https://kclinics.co.uk/api/webhooks/resend</code>	Webhooks
Resend · inbound replies	<code>https://kclinics.co.uk/api/webhooks/chat-inbound</code>	Inbound
Xero · OAuth redirect	<code>https://kclinics.co.uk/api/admin/integrations/xero/callback</code>	App → Redirect URIs
TrueLayer · OAuth redirect	<code>https://kclinics.co.uk/api/admin/integrations/truelayer/callback</code>	App → Redirect URIs
Google Business · OAuth redirect	<code>https://kclinics.co.uk/api/admin/integrations/google-business/callback</code>	Credentials → Redirect URIs
yay.com · call + voicemail	<code>https://kclinics.co.uk/api/integrations/yay</code>	Web Hooks

HOW TO KNOW YOU'RE DONE

Open the Connection Centre and press **Re-check now**. Every service you use should read green. Anything amber has one step left (usually a Connect click or a webhook); the card tells you which. Red means a key is missing or wrong.
