

TELEPHONY & SMS

Twilio & yay.com setup

Why texts aren't sending, and how to configure both accounts for everything we've built and planned — calls, voicemail, recordings, click-to-dial, and SMS.

For	Platform	Date
The owner	kclinics.co.uk	14 June 2026

01 Two separate systems — and the mix-up to fix

The confusion that's stopping texts: **Twilio sends text messages, yay.com handles phone calls. They are different systems with different numbers.**

What you want	Which system	The number it uses
Send appointment reminders / confirmations by SMS	Twilio	A number you buy <i>inside Twilio</i>
Log incoming/outgoing calls, voicemails, recordings	yay.com	Your existing clinic phone number
Click-to-dial a client from the dashboard	yay.com	Your clinic number + staff extensions

WHY SMS ISN'T WORKING RIGHT NOW

You put the clinic landline in the Twilio “from” field. Twilio can only send texts from a number it owns — a landline it doesn't control is rejected on every send. The landline is correct for **yay.com** (calls); Twilio needs its own number (Section 02). They don't share a number.

K's tip

Rule of thumb: anything that's a text message → Twilio. Anything that's a phone call → yay.com. Keep them in separate boxes in your head and it stays simple.

02 Twilio — set up SMS fully

Powers today: booking confirmations and appointment reminders by text (to clients who opted in). Planned: two-way SMS conversations — the setup below supports both, so you only do it once.

A · Create the account

1. Go to [twilio.com](https://www.twilio.com) and sign up with the clinic email; verify your email and a mobile.
2. In the console, note your **Account SID** and **Auth Token** (Account → API keys & tokens / the dashboard home).

B · Get a sending number (the important bit)

UK numbers need a one-time identity/address check (a “Regulatory Bundle”). Pick ONE of these:

1. **UK mobile or local number (recommended for two-way):** Phone Numbers → Manage → Buy a number → Country **United Kingdom** → tick **SMS** (and Voice if you want calls too) → Buy. Twilio will prompt you to submit a **Regulatory Bundle** (business name, address, ID) — complete it; approval is usually 1–2 days.
2. **Alphanumeric Sender ID (one-way only, fastest):** Messaging → Sender IDs → add **KClinics**. Texts show “KClinics” as the sender, but clients can't reply. Good now; switch to a real number later for two-way.

C · (Recommended) Create a Messaging Service

1. Messaging → Services → Create. Add your new number (or Sender ID) to its **Sender Pool**.
2. Turn on **Advanced opt-out** so STOP / HELP replies are handled automatically (UK compliance).
3. This gives you one stable “sender” that scales and stays compliant. Use its **Messaging Service SID** (starts **MG...**) as the from value if you create one.

D · Put the keys into KClinics

1. Open Admin → **Connection Centre** → the **SMS — Twilio** card.
2. Paste **Account SID** and **Auth Token**.
3. For **Twilio from number**, enter your Twilio number in full international form (e.g. **+447...**) or the Messaging Service SID (**MG...**). **Not** the clinic landline.
4. Save, then press **Re-check now** — the card turns green.

CONSENT IS BUILT IN

The platform only texts clients who ticked “SMS reminders” — you don't need to manage opt-in lists by hand. Keep STOP handling on (step C) so anyone who opts out is removed automatically.

K's tip

Buy a number with BOTH SMS and Voice capability even if you only text today. It costs the same and means two-way SMS (planned) and any future call features just work without re-buying.

03 yay.com — set up calls fully

Powers: every call logged against the client automatically, voicemail transcripts, call recordings, caller → client/supplier matching, and click-to-dial from the dashboard. The main step is one webhook; the rest are optional extras.

A · Call logging webhook (do this first)

1. In yay.com open **Settings** → **Web Hooks** (or Integrations / API).
2. Add a hook for **Call Ended**: URL `https://kclinics.co.uk/api/integrations/yay`, method **POST**.
3. Add a second hook for **Voicemail Notify** to the **same URL**.
4. Set the **Auth Token** / shared secret to the value held in `YAY_WEBHOOK_SECRET` (set in hosting). yay sends it as a Bearer header and we verify it.
5. Make a test call to the clinic, hang up, and check **Admin** → **Calls** — it should appear within seconds, matched to the client if their number is on file.

B · Recordings & transcripts

1. Enable **call recording** in yay (account-wide or per extension/user).
2. If your yay plan includes voicemail/call transcription, the transcript flows in automatically; otherwise the recording is stored and can be played from the call record.
3. Recordings and transcripts are encrypted at rest and scrubbed automatically after ~13 months (retention policy).

C · Click-to-dial (optional — place calls from the dashboard)

1. In yay's **API** settings get your **Reseller**, **User** and **Password**.
2. Set `YAY_AUTH_RESELLER`, `YAY_AUTH_USER`, `YAY_AUTH_PASSWORD` in hosting (Vercel env), then redeploy.
3. In yay, add this server's egress IP to **Allowed IP ranges** (ask us for the current IP), or the API will reject the calls.
4. Make sure each staff member has a **SIP extension** so the system knows which handset to ring.

D · Extensions & attribution

1. Give each clinician/desk a SIP extension in yay so calls are attributed to the right person.
2. Keep client phone numbers tidy in the CRM — matching is on the last 9 digits, so it copes with +44 / 0 / spacing, but a wrong number won't match.

K's tip

You only need step A for the headline feature (calls logged on the client record). B, C and D are upgrades you can add whenever — nothing else depends on them.

04 Prove it all works

Test	How	Pass looks like
Twilio key	Connection Centre → Re-check	SMS — Twilio card is green
Send an SMS	Book a test appointment with an opted-in mobile, or trigger a reminder	The text arrives from your Twilio number/sender
Call logging	Phone the clinic and hang up	The call shows in Admin → Calls within seconds
Voicemail	Call and leave a message	A voicemail call record appears (with transcript if enabled)
Click-to-dial	Open a client → press call (if configured)	Your handset rings, then connects to the client

WHERE TO LOOK

SMS status lives on Connection Centre / API health. Calls live on **Admin** → **Calls**. If Twilio stays red after a correct key, the number isn't SMS-capable or the Regulatory Bundle isn't approved yet. If calls don't appear, re-check the webhook URL and that the secret matches `YAY_WEBHOOK_SECRET`.

05 Reference — what goes where

Setting	Value	Where it lives
Twilio Account SID / Auth Token	From the Twilio console	Connection Centre → SMS — Twilio
Twilio from	Twilio number +44... or Messaging Service MG...	Connection Centre → SMS — Twilio
yay call + voicemail webhook	https://kclinics.co.uk/api/integrations/yay	yay.com → Web Hooks
yay webhook secret	Matches YAY_WEBHOOK_SECRET	yay webhook "Auth Token" + hosting
yay click-to-dial creds	YAY_AUTH_RESELLER / USER / PASSWORD	Hosting (Vercel) — optional
Server IP allow-list	This server's egress IP	yay → Allowed IP ranges — optional
